

Enable Companies That Use Microsoft SCCM to **Manage Mac Effortlessly**

Parallels® Mac Management for Microsoft® SCCM is a plug-in that extends SCCM to control and manage Mac® computers alongside Windows PCs in your IT infrastructure.

Companies save on costs and resources by not having to purchase a standalone solution to manage Mac.

Partner Benefits

Joining the Parallels Partner Program is free, and there is no upfront commitment. Not only do you get 10% deal registration, but you also receive sales materials and guides to help identify and drive new customer business conversations. Receive free access to online training events—and 100% of our deals go to partners!

No Expensive Secondary Consoles Needed

Effectively integrate into the existing SCCM infrastructure to manage Mac computers along with PCs from a single pane of glass. All assets are centralized, allowing for easier administration that drives down IT operating costs by reducing duplicate work.

No macOS Expertise Required

Parallels Mac Management takes hours instead of days to deploy. Plus, it requires no additional infrastructure or training since it extends the existing SCCM infrastructure, processes and skills. Manage Mac computers and their software discovery, distribution and inventory just like PCs.

Prevent Data Breaches

A single Mac machine can be a point of attack or data loss if it's not secured, patched and up to date. Parallels Mac Management maintains control, security and compliance. An automated enrollment process allows IT admins to configure any Mac computer remotely.

We are now able to administer our entire heterogeneous fleet of computers and the applications used on them in a centralized manner with the aid of one single product, Microsoft SCCM, and a powerful expansion called Parallels Mac Management.”
